

```

struct node {
    int data;
    node * next;
}
node * front, * rear;

```

Structure

```

enqueue (front, rear, data);
int data = dequeue (front, rear);

```

getting access to members

Front → data  
Front → next

Structure inside another Structure

```

struct Queue {
    node * front;
    node * rear;
}

```

```

enqueue (que, data);
int data = dequeue (que);

```

que.front → data  
que.front → next

getting access to members

Queue **que**

Two Queues, One Structure

```

struct node {
    int data;
    node * next;
}

```

node \* front1, \* rear1

node \* front2, \* rear2

```

struct node {
    int data;
    node * next;
}

```

```

{
    struct Queue {
        node * front;
        node * rear;
    }
}

```

struct **que1, que2;**
